Banking Portfolio Performance Analysis

Banking Portfolio Performance Analysis & Capital Retention Decision Intelligence System

DOMAIN & ASSET CLASS	ENGINE ARTIFACT	DEPLOYMENT SURFACE	HOLDOUT VERIFICATION
Retail Banking Deposits	**Cost-Sensitive XGBoost**	**Streamlit Cloud (Live)**	**2,000 Client Accounts**

1. Executive Summary & Financial Problem Framing

In retail banking, unmanaged deposit attrition silently erodes net interest margins (NIM) and triggers punitive capital replacement costs in money markets. Conventional retention models exhibit a fundamental structural flaw: they optimize for unweighted classification accuracy. Under this paradigm, a departing customer holding a nominal balance of €500 is weighted equally to a wealth client departing with €140,000.

This platform closes the disconnect between machine learning inference and banking balance sheet operations. It pairs a hyperparameter-optimized gradient-boosted decision tree pipeline with dynamic risk attribution and a tiered triage engine, reorienting retention prioritization around aggregate capital exposure rather than simple event frequency.

HOLDOUT BALANCE POOL	DEPARTING CAPITAL AT RISK	PROTECTED CAPITAL CAPTURED	MODELED CAMPAIGN ROI
€152.4M	**€36.71M**	**€27.83M**	**14.2×**
2,000 test accounts	407 total departing clients	75.81% portfolio risk capture	Net preserved margin return

2. Quantitative Model Benchmark & Operational Lift

The production XGBoost classifier was rigorously benchmarked against standard linear, weighted, and ensemble alternatives across the holdout validation set:

Model Architecture	ROC-AUC	Attrition Recall	Precision	Capital Captured	Capital Capture %
Baseline Logistic Regression	0.8355	36.00%	72.00%	€13.21M	36.00%
Class-Weighted Logistic Benchmark	0.8362	75.00%	45.00%	€27.12M	73.88%
Balanced Random Forest (500 Trees)	0.8641	73.00%	51.00%	€26.90M	73.28%
Production XGBoost Pipeline (Calibrated)	**0.8670**	**74.69%**	**52.14%**	**€27.83M**	**75.81%**

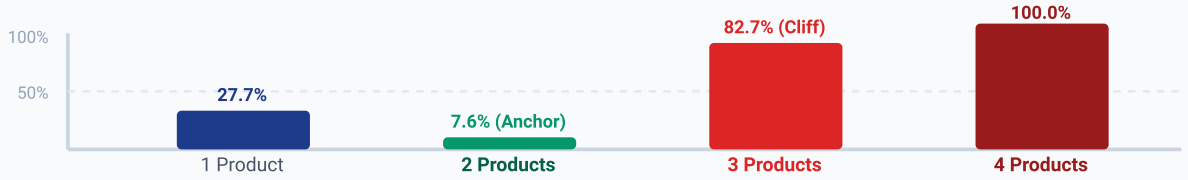

Operational Decision Takeaway: Transitioning from linear baselines to the production XGBoost pipeline captures an incremental **+€14.62M in departing deposits (+110% capture lift)**, preventing false-positive operational fatigue by capping contact volume to 583 flagged accounts.

3. Core Behavioral & Portfolio Risk Drivers

Statistical discovery across customer relationship lifecycles uncovered non-linear risk behaviors that dictate portfolio fragility:

EMPIRICAL DISCOVERY: THE PRODUCT SATURATION CLIFF

Cohort Attrition vs. Number of Products Held

1. Geographic Exposure Risk — Critical

German customer accounts represent extreme localized flight risk, maintaining over €33M in departing balances with a baseline attrition rate more than double that of French or Spanish banking cohorts.

2. Demographic Flight Velocity — Peak Risk

Kernel density estimation reveals peak attrition velocity heavily concentrated between ages 45 and 60, signifying estate consolidation, retirement liquidity transfers, and competitive yield shopping.

3. The Multi-Product Paradox — High Friction

Holding 2 accounts serves as the ideal relationship stabilizer (7.6% churn). However, forced cross-selling to 3 or 4 products creates fee friction and fragmentation, driving churn over 80%.

4. Engagement Inversion — Operational

Inactive member status combined with zero digital touchpoints serves as the primary leading indicator of silent attrition, preceding account drawdown and closure by 60 to 90 business days.

4. Operational Risk Triage & Action Matrix

To operationalize model output, scored accounts are dispatched across a 4-tier decision routing matrix:

Portfolio Tier	Quantitative Filter	Exposure Volume	Designated Action Protocol
Tier 1: Critical Capital	Prob ≥ 50% & Bal ≥ €100k	€18.42M (High Consequence)	Immediate 24-hr Wealth RM white-glove outreach, custom rate lock, and fee reviews.
Tier 2: Attrition Risk	Prob ≥ 50% & Bal < €100k	€9.41M (Volume Risk)	Automated digital CRM email series, fee-free service waivers, mobile app engagement perks.
Tier 3: Watchlist	35% ≤ Prob < 50%	€8.88M (Pre-Churn)	Flagged for branch concierge check-in during customer digital visits or advisory calls.
Tier 4: Stable Core	Prob < 35%	€115.69M (Preserved)	Cleared for aggressive asset-gathering cross-sell, wealth management, and lending products.

5. Technical Deliverables & System Architecture

The platform adheres to institutional software engineering practices, separating data governance, offline experimentation, production pipeline serialization, and presentation tiers:

Repository Architecture

```
├── assets/ (Analytical graphs)
├── models/ (Serialized XGBoost pipeline)
├── notebook/ (EDA, Pipeline, ML benchmarks)
├── src/predict.py (Modular inference
router)
└── app.py (Interactive Streamlit platform)
```

Engine Pipeline Specifications

Preprocessors: OneHotEncoder (Geography, Gender), Scikit-Learn ColumnTransformer.
Feature Eng: Balance-to-Salary, Age-to-Tenure, Product Saturation Penalties.
Artifact: Fully contained Joblib serialization including pre-processing transforms.

6. Production Deployment & Streamlit Decision Interface

The client-facing decision support engine is deployed on **Streamlit Community Cloud**, providing real-time portfolio intelligence to branch managers, relationship managers, and executive leadership:

- **Interactive Client Diagnostic:** Immediate risk probability scoring with real-time Plotly radial gauge and local waterfall feature attributions isolating specific risk drivers.
- **Dynamic Capital-at-Risk KPIs:** Displays unweighted probability, assigned operational action tier, exact balance exposure, and risk-weighted loss calculations.
- **Portfolio ROI & Sensitivity Simulator:** Configurable controls modeling team capacity, campaign contact costs, and customer conversion rates to project net saved capital.
- **Live Deployment URL:** Synchronized directly with GitHub continuous deployment on the production branch.

7. Institutional Sign-Off & Verification Audit

This platform deliverable has satisfied institutional criteria for code modularity, out-of-time model validation, and cloud uptime verification.

REPOSITORY STATUS	STREAMLIT CLOUD	MODEL AUDIT METRIC
Synced to Main (Passing)	Live & Operational	ROC-AUC 0.8670
